

Agricultural Calander – January

Agricultural Operations	
1.	Placing white gauze in greenhouses to close doors and ventilation openings.
2.	Ventilating greenhouses in the valley by opening side vents to reduce humidity.
3.	Continuous weeding and monitoring weather conditions to prevent the spread of fungal diseases. Spraying organic copper to prevent fungus, and Neemagreen for insects.
4.	Weeding and nursery of cultivated potatoes with irrigation and fertilization, and spraying Coppera Flostyl against late blight.
5.	Pruning olive and citrus trees, winter spraying after pruning, adding treated organic fertilizer and slow-release fertilizer: Granufert 18-18-5.
6.	Pruning almond trees, apples and grapes, especially those that have dropped all their leaves, before the buds swell, and winter spraying after pruning, taking into account peeling the dry bark from the stems of grapes before the spraying process so that they are not a source of infection with diseases or insects and to facilitate the access of pesticides to them. Also, add treated organic fertilizer and the slow release fertilizer Granufert 18-18-5 for trees.
7.	Collecting and disposing of citrus fruits infected with the Mediterranean fly, and weeding the orchard.
8.	Weeding in wheat and barley fields, spraying herbicides and adding high-nitrogen fertilizer 40-0-0 after a week of using herbicides.
9.	Continue planting Egyptian onion seedlings in the permanent soil during this month.
10.	Balancing irrigation quantities with the prevailing temperature to avoid the appearance of mold on the roots.
